## └ Overview

- AQC, more general umbrella term for the technique
- Quantum annealing as a subset of AQC and what that involves
- Music arrangement and why we're looking at this problem
- How the problem is solved, and the following results
- Conclusions and future work

## Adiabatic principle

A system remains in its instantaneous eigenstate if a given perturbation is acting on it slowly enough.<sup>1</sup>

<sup>1</sup>Born and Fock, 'Beweis des Adiabatensatzes'.

2025-03-09

## Theory

- └ Adiabatic quantum computing
  - └ Adiabatic quantum computing

- Adiabatic principle — system remains in the same eigenstate if perturbed slowly enough (without transferring heat)
- Equation shows evolution from initial Hamiltonian  $H_0$  to final  $H_p$  over time  $T$
- Importantly, if the system starts in the ground state, it will end in the ground state
- Impossible in practice as true adiabatic evolution would take infinite time, infinitely many steps

## Adiabatic principle

A system remains in its instantaneous eigenstate if a given perturbation is acting on it slowly enough.<sup>1</sup>

$$H(t) = \left(1 - \frac{t}{T}\right) H_0 + \frac{t}{T} H_p$$

<sup>1</sup>Born and Fock, 'Beweis des Adiabatensatzes'.

- └ Quantum annealing

2025-03-09

- Subset of AQC, relaxes the adiabaticity condition
- Annealing — slow heating of a material to change its properties
- Evolution time shortened (order of a few  $\mu\text{s}$ )
- End state no longer guaranteed, if started in ground state could end in excited state
- Able to run the evolution many times
- Probabilistic distribution of outcomes, sometimes will get lucky

# Quantum annealing

- Relaxes the adiabaticity

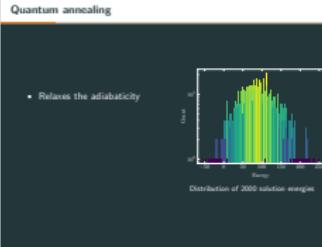

## Quantum Annealing for Music Arrangement

2025-03-09

### Theory

#### Quantum annealing

##### Advantages

- Why is this technique useful?
- Allows us to find the ground state of complicated Hamiltonians by starting from an easy one
- Diagram — energy against configuration space, simulated annealing (classical) traverses the "energy landscape" whereas quantum annealing tunnels through it
- As opposed to classical methods, does not get affected by local minima
- Technique very good for solving optimisation problems e.g. travelling salesman, with complicated energy landscapes

# Advantages

- Find the ground state of complicated Hamiltonians

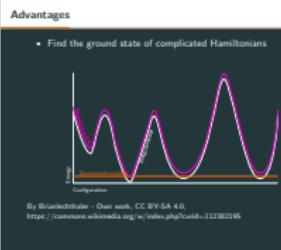

By Brianlechthaler - Own work, CC BY-SA 4.0,

## Quantum Annealing for Music Arrangement

### Motivations

- └ Music arrangement
- └ Music arrangement

2025-03-09

- Adaptation of music in terms of instrumentation, medium, or style
- Traditionally a complex process that requires a deep understanding of musical theory and structure
- Reduction is the rewriting of music for a smaller number of instruments (for example string quartet)
- Very large configuration space, many different combinations of notes that could produce the final arrangement
- For those interested, NP-hard in computational complexity theory, cannot be solved in polynomial time
- NB: all scores shown are own reproductions from public domain files

# Music arrangement

- Adaptation of previously composed pieces for practical or artistic reasons

# 1. Split score

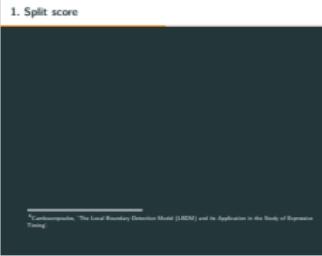

<sup>6</sup>Cambouropoulos, 'The Local Boundary Detection Model (LBDM) and its Application in the Study of Expressive Timing'.

## Quantum Annealing for Music Arrangement

### Method

#### 1. Split score

2025-03-09

- First stage to separate each part of original score into phrases
- Phrases — smallest unit of music that preserves melody and structure
- Boundaries between phrases found using LBDM
- Measures the degree of change of a certain parameter ( $x$ ) between notes ( $i$ ) (explain equation)
- Strength calculated for both pitch and IOI, weighted and summed to give the final strength
- Strengths above a threshold value are considered phrases

## 1. Split score

- Musical phrases chosen as smallest unit of music
- Preserve melody and structure when rearranged

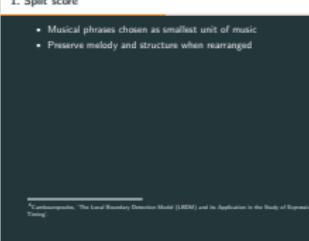

<sup>6</sup>Cambouropoulos, 'The Local Boundary Detection Model (LBDM) and its Application in the Study of Expressive Timing'.

### 3. Create optimisation problem

└ 3. Create optimisation problem

2025-03-09

- Use a graph theory problem to create the optimisation problem that matches our constraints
- Here each colour represents an instrument we are arranging for
- QUBO, set of  $n$  colours,  $x_{v,i}$  is 1 if node  $v$  is colour  $i$
- $A$  — each node is only coloured once, sum over colours is one
- $B$  — penalise adjacent nodes with the same colour
- $C$  — weight of each node, preference for certain nodes
- $D$  — weight of each edge, preference for certain edges
- Weights here are musical entropy i.e. how interesting the phrase is musically

### 3. Create optimisation problem

#### Proper vertex colouring

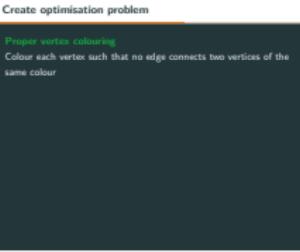

Colour each vertex such that no edge connects two vertices of the same colour

#### Quantum Annealing for Music Arrangement

- Smaller instrumentation and length (about 3 min), keeping the problem graph small and manageable
- Musical style has well-defined structure and phrases

Score

- Smaller ensemble chosen for problem size

Quartet No. 1 in Bb major by Joseph Haydn

A small thumbnail image of the musical score for Quartet No. 1 in Bb major by Joseph Haydn, showing a portion of the staves.

# Score

- Smaller ensemble chosen for problem size
- Well-defined musical structure

The image shows a musical score for 'Quartet No. 1 in B<sub>b</sub> major' by Joseph Haydn. The score consists of three staves of music for string instruments. The top staff is for Violin I, the middle for Violin II, and the bottom for Cello. The music is in common time and includes various musical markings such as dynamic changes and performance instructions. The title 'Quartet No. 1 in B<sub>b</sub> major' and the composer's name 'Joseph Haydn' are printed at the top of the score.

## Phrase detection

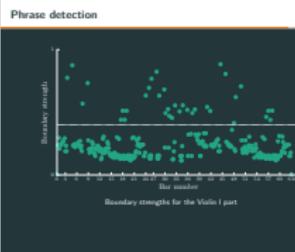

## Quantum Annealing for Music Arrangement

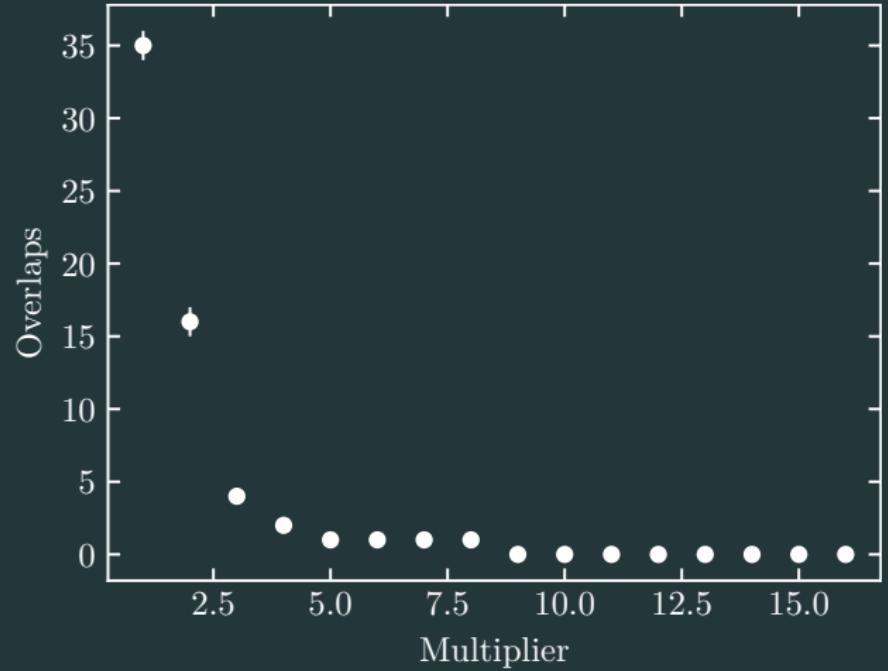

### Results

#### Phrase detection

- Example of the LBDM finding suitable boundaries for phrases
- Threshold value of 0.4 chosen manually

## QUBO parameter variation

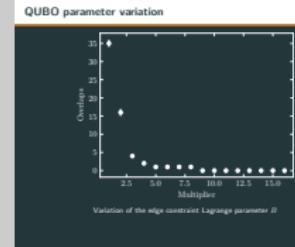

Variation of the edge constraint Lagrange parameter  $B$

## Quantum Annealing for Music Arrangement

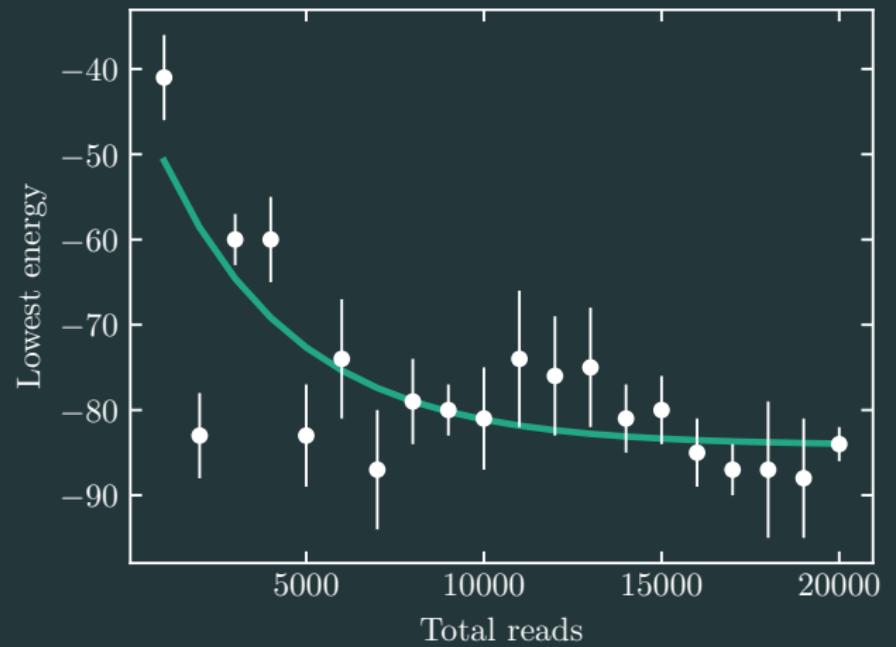

### Results

#### QUBO parameter variation

- Each QUBO problem submitted five times with different edge constraint Lagrange parameter
- Checking against fulfillment of the desired constraint
- Lagrange parameters taken as multipliers of the maximum node weight for normalisation
- 12.0 chosen as the best parameter, with all others equal to one

# Optimisation

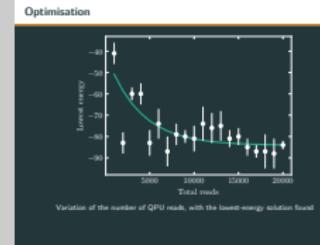

Variation of the number of QPU reads, with the lowest-energy solution found

## Quantum Annealing for Music Arrangement

### Results

#### Optimisation

2025-03-09

- Once Lagrange parameters chosen, can check how well the annealer optimises the problem
- In general, more reads is more likely to find lower-energy solutions
- Sometimes the annealer gets lucky (see 2000 reads)
- Each number of reads repeated five times, exponential decay fitted

2025-03-09

# Conclusions

---

2025-03-09

- Successful application of this method on a new problem
- QPU returns samples that fulfill the constraints of the problem, creating a valid arrangement
- New technology, limited in power
- What would it take for quantum to show advantage?

# Conclusions

- Successful novel application of quantum annealing

### └ Conclusions

### └ Conclusions

- Successful application of this method on a new problem
- QPU returns samples that fulfill the constraints of the problem, creating a valid arrangement
- New technology, limited in power
- What would it take for quantum to show advantage?

- Successful novel application of quantum annealing
- QPU returns low-energy samples
- Necessary constraints for a valid arrangement fulfilled
- Still very new technology, does not show quantum advantage (yet)

### Quantum Annealing for Music Arrangement

#### └ Conclusions

#### └ Future work

2025-03-09

Future work

<sup>7</sup>Pearce and Wiggins, 'Towards A Framework for the Evaluation of Machine Compositions'.

- How well does the method scale with larger scores? How well can it find low energies with smaller problems?
- Compare to classical optimisation methods, time to solution, energy of solutions
- Only tuned one parameter by hand, could use a more systematic approach to find lower-energy solutions
- Quality judgement — Turing-like test, present subjects with human-/computer-generated scores

<sup>7</sup>Pearce and Wiggins, 'Towards A Framework for the Evaluation of Machine Compositions'.

## Future work

- Variation in problem size

## Boundary strength

$$S_i = x_i \times (r_{i-1,i} + r_{i,i+1})$$

$$r_{i,i+1} = \frac{|x_i - x_{i+1}|}{x_i + x_{i+1}}$$

## Normalisation

$$S'_i = \frac{S_i - \min(S_i)}{\max(S_i) - \min(S_i)}$$

## Weighting

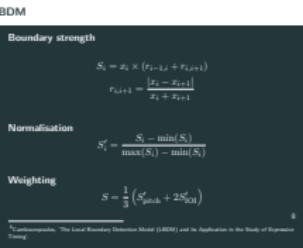

$$S = \frac{1}{3} (S'_{\text{pitch}} + 2S'_{\text{IOI}})$$

<sup>8</sup>Cambouropoulos, 'The Local Boundary Detection Model (LBDM) and its Application in the Study of Expressive Timing'.

2025-03-09

└ LBDM

- Boundaries always taken at beginning/end of piece
- Weightings derived by trial and error

## Phrase entropy

$x_i$  — parameter  $x$  of note  $i$

### Shannon entropy

$$H(X) := - \sum_i P(x_i) \log_2 P(x_i)$$

### Probability distribution

$$P(x_i) = \frac{n_i}{N}$$

└ Solution graph

# Solution score

A musical score for three woodwind instruments: Flute, Oboe, and Bassoon. The score consists of four staves, each with a treble clef and a key signature of one flat. The Flute staff starts with a measure of eighth notes followed by a measure of sixteenth-note patterns. The Oboe staff follows with eighth-note patterns. The Bassoon staff has eighth-note patterns. Measures 5 through 14 show the instruments playing eighth-note patterns in various rhythmic patterns. Measure 15 shows the Flute and Oboe playing eighth-note patterns, while the Bassoon rests. Measure 16 shows the Flute and Oboe continuing their eighth-note patterns.
